

## ReactJs Test

You are tasked to create a working prototype based on the wireframes below.

It should have the following features:

- Header that shows logo - button to home page- button to cart page.
- Home page should show few products with (image - product name - price and 2 buttons more info and add to cart)
- Single product page should show (image - product name - price - description and cart area with adjustable quantity)
- Cart page show the products added to cart ,adjust the quantity plus showing the total amount.

Technical requirements:

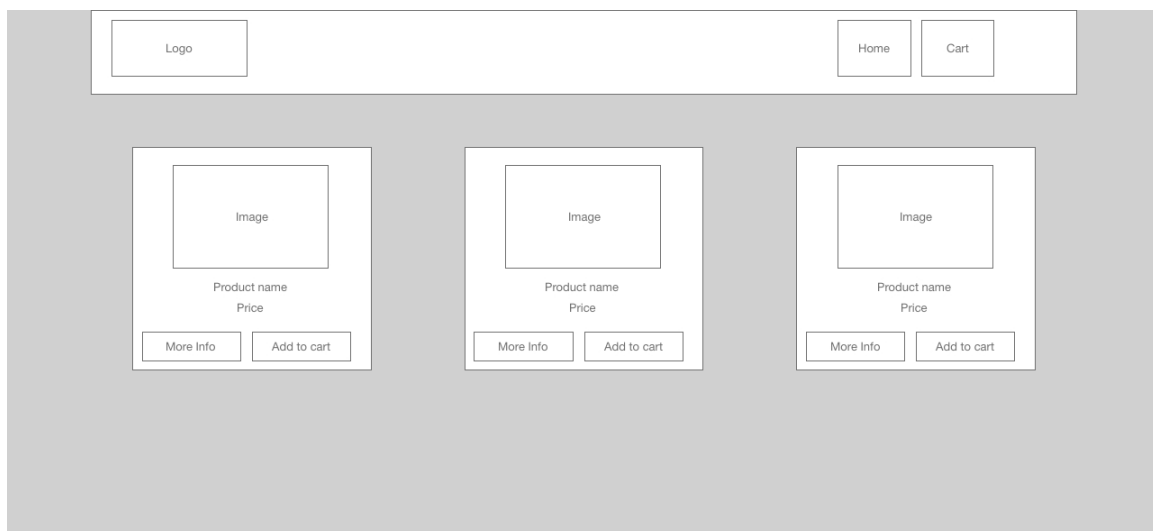

- Please use React framework for your prototype.
- Should use Typescript
- Use fake static data for the products information.
- The app should follow the atomic structure modal to handle components.
- Should use SCSS for styling.
- Components must be reusable.
- Components must have tests

Bonus

- Use storybook to display individual components.
- Add animation and appealing UI

Deliverable

- The project should be hosted in a GIT repository.
- It should work in the latest version of Chrome, no need to support older browsers.
- We should be able to download your repository, install dependencies and then run the project without errors.
